Kanban Workshop – Students' Instructions

🎯 Goal

Learn how to transform User Stories into tasks and manage them with a Kanban board.

👬 Team setup

- Work in groups of 4–5 students.
- Use **Microsoft Whiteboard** to collaborate online.

📝 Activity steps

1. **Choose 2–3 user stories** from the example backlog provided in class.
   Example:
   - As a data scientist, I want to clean raw CSV data so that I can build a predictive model.
   - As a product owner, I want to see a dashboard of model results so that I can make business decisions.
2. **Break down each User Story into tasks.**
   - Example tasks: "Remove missing values", "Normalize columns", "Generate plots with matplotlib", "Create dashboard layout", "Add login page", etc.
3. **Build your Kanban board in MS Whiteboard.**
   - Decide the **columns** (e.g., To Do – In Progress – Review – Done).
   - Define **Work In Progress (WIP) limits** for the team.
   - Agree on **policies** (e.g., "Only one task per person at a time", "All tasks must be peer-reviewed before Done").
4. **Move tasks across the board** as you simulate working on them.
5. **Reflect at the end:**
   - Where did bottlenecks appear?
   - How did WIP limits influence your workflow?
   - What would you improve in your Kanban design?

⏱️ Time

- Board setup and tasks: 25 min
- Simulation and execution: 20 min
- Reflection: 15 min
